Sinopsis

ISBN: 1405125845

Advances in biomedical technology have grown at an increasingly swift rate, particularly within the latter half of the 20th century. The accelerated pace at which medical advances are developing have created a host of ethical issues that have no consensus or set standards against which to be measured; even the most basic concepts of life and death now require redefinition. Scientists, theologians, doctors, lawyers, philosophers, and others have all taken part in the task of beginning to try to solve the ethical problems raised by new technology.
