Sinopsis

ISBN: 9780306455186

This groundbreaking text applies the concepts of complexity science to provide a unified scientific explanation of all aspects of human creativity. The book clearly describes the psynet model-a novel complex-systems theory-that integrates ideas from computer science, mathematics, neurobiology, philosophy, and cognitive and personality psychology. Goertzel shows how common computer science algorithms, such as neural nets and genetic algorithms, fit into the mental and creative process, and proposes that the understanding of mathematics must be extended to successfully deal with the mind's workings.
