Swedin and Ferro provide a compelling history of computer technology. Beginning with mathematical and technical innovations ranging from the abacus to the Internet and beyond, they take the reader on a fascinating journey through the inventions that lead to the IBM and Cray supercomputers, as well as the desktop personal computer and PDAs. A time line from 35,000 BCE to 2003 CE offers the reader a broad overview of mathematics and inventions such as the abacus, printing press, typewriter, and television, which were precursors to the computer. This book will be most useful for readers desiring to learn about computer history and the people who developed the inventions leading to the current level of computer technology.
